OFFSET PRINTING

Is a commonly used technique in which the inked image is transferred (or “offset”) from a plate to a rubber blanket, then to the printing surface. When use in combination with the lithographic process, which is based on the repulsion of oil and water, the offset technique employs a flat (Planography) image carrier. Ink roller transfer ink to the image areas of the image carrier, while a water roller applies a water-based film to the non- image areas. The modern “Web” process feeds a large reel of paper through a large press machine in several parts, typically for several meters, which then prints continuously as the paper is feed through.

PRESS

Press printing is the final step in the printing process, where an image is transferred from a printing plate to a substrate, such as paper or fabric. The process typically involves inking the printing plate, passing the substrate through the press, and repeating the process as needed for multi-colored products. Press printing can produce high-quality printed products with sharp images and vibrant colors. It is also a relatively quick process, allowing for high-volume production.
